Report Overview

A Bipolar Hall Sensor is a type of sensor that detects the presence of magnetic fields and translates this information into an electrical signal. It operates based on the Hall effect, where a voltage is generated at a right angle to the direction of current flow and the magnetic field. A Bipolar Hall Sensor can detect both positive and negative magnetic fields, making it useful for applications that require directional detection or sensing of changes in magnetic field strength. It is commonly used in devices like joysticks, mice, and other input devices that require positional feedback.
