### Report Overview

Bispecific monoclonal antibodies (MAbs) are a class of engineered proteins that possess the ability to bind to two distinct antigens simultaneously. These antibodies are designed to bring together two different cells or to bind two different epitopes on the same cell, thereby modulating the interaction between them. The primary goal of bispecific MAbs is to enhance the immune response against cancer cells or to target specific cell populations for therapeutic purposes. They are created through various techniques, including the fusion of two different hybridoma cells, chemical linkage of two different MAbs, or the use of recombinant DNA technology to generate a single molecule with two different antigen-binding sites. Bispecific MAbs offer a versatile platform for therapeutic applications, such as redirecting immune effector cells to tumor cells, blocking dual signaling pathways in cancer cells, or enhancing the specificity and efficacy of drug delivery to target cells.
