Report Overview

The blood administration set is a medical device designed for the safe and controlled transfusion of blood and blood components from a donor or storage bag to a patient. It typically consists of sterile tubing, a drip chamber, a flow regulator, and a needle or connector, ensuring proper filtration and flow rate to prevent complications such as air embolism, clotting, or contamination. These sets are essential in hospitals, blood banks, and emergency care settings, often incorporating features like inline filters to remove microaggregates and leukocytes, enhancing patient safety. The market for blood administration sets is driven by increasing surgical procedures, rising demand for blood transfusions in trauma and chronic disease cases, and advancements in transfusion technology.
