Abstracts

Indoor positioning device refers to the equipment network that can locate people or objects in the indoor environment. It usually consists of two distinct elements: anchor and position tags. Anchor is a device, such as a beacon or a relay, strategically placed in a defined space. Tags are carried by people or things. Anchor either actively locates the mobile device and tag, or provides an environment location or context for the device to be aware of. Wi-fi and Bluetooth can work based on existing network infrastructure. It's easy to install and low cost. Its main working principle involves the use of received signal strength (RSS), which depends on the distance between the sender and receiver. Three measurements can be used to calculate the location of mobile devices by simply measuring the RSS of a tag to multiple Bluetooth beacons or Wi-Fi access points.

The global Bluetooth Indoor Positioning Device market size was estimated at USD 780.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
