Report Overview

A board processing machine is a device that creates a circuit board by depicting a circuit pattern on a base on which a copper plate, the original of the board, is stretched. Board processing machines are equipped with a set of processing software. The software processes the board by loading the drawings to be processed on the board into the software. There are two types of substrate processing methods: the cutting method, in which substrates are made by cutting a copper plate covered base, and the photosensitive method, in which substrates are made by exposure and etching.
