Report Overview

Bone Densitometry Systems are advanced medical imaging devices designed to measure the bone mineral density (BMD) in patients, providing crucial information for the diagnosis, monitoring, and management of various bone-related conditions, such as osteoporosis, osteopenia, and fractures. These systems utilize low-dose X-ray technology to scan specific areas of the body, such as the spine, hip, wrist, or forearm, and generate precise measurements of bone density. The results are then compared to a reference database to determine the patient's T-score and Z-score, which are key indicators of bone health and risk of fractures. Bone Densitometry Systems are essential tools in the early detection and treatment of bone diseases, helping healthcare professionals make informed decisions and develop personalized treatment plans for patients.
