### Report Overview

Bone grafts and bone powder are medical materials used in orthopedic and dental procedures to facilitate bone healing and regeneration. Bone grafts involve the transplantation of bone tissue from one area of the body (autograft) or from a donor source (allograft) to another, promoting the growth of new bone. Bone powder, often derived from processed bone grafts, consists of finely ground particles that can be used to fill voids or gaps in bones, aiding in the formation of new bone tissue. These materials are commonly employed in procedures such as spinal fusions, dental implant surgeries, and orthopedic reconstructions to address fractures, defects, or degenerative conditions. The use of bone grafts and bone powder helps provide structural support, stimulate bone formation, and accelerate the healing process in musculoskeletal applications.
