Report Overview

Boric Acid-Free Nickel Plating is a specialized electroplating process used in the manufacturing industry to apply a thin layer of nickel to metal surfaces without the use of boric acid. This method is designed to enhance the corrosion resistance, wear resistance, and overall performance of the treated metal parts. The process involves immersing the metal in a solution containing nickel ions and other additives, and then applying an electric current to facilitate the deposition of nickel onto the metal surface. By eliminating boric acid, this plating technique aims to reduce environmental impact and improve the sustainability of the electroplating process, while still maintaining the desired properties of the nickel coating.
