### Report Overview

Brain reading robots represent an emerging category of neurotechnology that combines advanced brain-computer interfaces (BCIs) with robotics to interpret neural signals and translate them into physical actions. These systems leverage EEG, fMRI, or invasive neural implants to decode brain activity, enabling applications such as assistive robotics for individuals with mobility impairments, mind-controlled prosthetics, and even consumer-grade devices for gaming or smart home control. The technology sits at the intersection of neuroscience, AI, and robotics, with growing interest from healthcare, defense, and consumer electronics sectors. While still in relatively early stages, advancements in machine learning for neural pattern recognition and miniaturized hardware are accelerating commercialization. Ethical concerns around privacy, data security, and cognitive autonomy remain significant hurdles to widespread adoption. The market is currently dominated by specialized medical devices but is expected to expand into broader industrial and consumer applications as non-invasive BCIs improve in accuracy and affordability.
