Report Overview

The Branched Stent Graft System is a sophisticated medical device utilized in surgical procedures, particularly in vascular and endovascular interventions. It is designed to provide a minimally invasive alternative to traditional open surgery for treating complex aortic pathologies. This system features a main body stent graft with an integrated branch, which allows for the simultaneous repair of both the main aortic vessel and a branching vessel, such as the renal or visceral arteries. The device is typically made from a combination of flexible materials, including polyester or ePTFE graft material, and a metallic stent framework, which provides structural support and facilitates accurate deployment. The Branched Stent Graft System aims to maintain or restore blood flow in the treated vessels while minimizing the risk of complications such as endoleaks or vessel occlusion. Its use can lead to reduced procedural time, less blood loss, and faster recovery times for patients compared to open surgery.
