Report Overview

Breast cancer is one of the most common malignant tumors in women, which poses a great threat to women's life and health. In recent years, as people pay more attention to women's health, the detection methods of their diseases have been greatly improved. Breast cancer tests include screening tests, diagnostic tests and monitoring tests. Screening tests, such as annual mammograms, are given regularly to people who appear healthy and who are not suspected of having breast cancer. The goal is to detect breast cancer early, before any symptoms appear, and cancer is often easier to treat. Diagnostic tests (such as biopsies) are for people suspected of having breast cancer (such as biopsies). These tests are used to determine whether breast cancer is present and, if so, whether it has reached the outside of the breast. Diagnostic tests are also used to gather more information about cancer to guide treatment decisions. Once breast cancer is diagnosed, many tests are used during and after treatment to monitor how well therapies are working. Monitoring tests also may be used to check for any signs of recurrence.
