## Abstracts

Exhaled breath molecular diagnosis is an emerging in vitro diagnostic (IVD) technology. Generally speaking, in vitro diagnosis requires the use of diagnostic reagents and equipment to analyze samples such as blood or urine. Sampling is done first and then analysis is done. Cells, microorganisms and biochemical molecules can be analyzed. It is mainly used for the diagnosis of blood circulation or systemic diseases. Exhaled breath molecular diagnosis does not require diagnostic reagents, and sampling and analysis can be performed at the same time. The gas molecules produced by cell and microbial metabolism are analyzed, which is particularly suitable for the diagnosis of respiratory and digestive diseases. Exhaled breath molecular diagnosis complements blood tests and imaging diagnosis. Like existing in vitro diagnosis, exhaled breath molecular diagnosis is also divided into two categories: professional laboratories and point-of-care diagnosis (POCT). Professional laboratories use laboratory analysis equipment such as gas chromatography, mass spectrometry and spectroscopy to perform exhaled breath analysis on patients' exhaled gas sampling bags or gas sampling tubes; due to the lack of exhaled breath sensor products, Europe and the United States currently provide analytical services for exhaled metabolomics of H<sub>2</sub>, CH<sub>4</sub> and VOC (volatile organic compounds) through professional laboratories. Point-of-care diagnosis (POCT) uses exhaled breath detection sensors, which integrate sampling and analysis. It only takes a few seconds for patients to sample their exhaled breath, and only tens of seconds for the instrument to analyze the results. In summary, the issuer belongs to the POCT sub-industry in the emerging IVD field. Exhaled breath molecular diagnostic equipment is classified as a low-risk medical device by European and American drug regulatory authorities. The US FDA believes that breath testing will affect the results of medical diagnosis. As a Class II medical device, it only tests and certifies the performance of breath testing. The EU regulates it as a special Class I medical device similar to a sphygmomanometer. It only needs to be tested by itself or by a third-

party laboratory according to the EN standard. Therefore, exhaled breath molecular diagnostic equipment was first listed in Europe, and there are a large number of them now. China currently regulates exhaled breath molecular diagnostic equipment as a Class II medical device, and it takes a long time to register. At present, most medical devices related to exhaled breath molecular diagnostic technology are in the market cultivation or introduction stage, requiring a large number of clinical trials, certification and registration. POCT based on exhaled breath molecular diagnosis can provide detection items that blood test POCT lacks, such as detection of airway inflammation and gastrointestinal flora metabolic disorders. Moreover, POCT based on exhaled breath molecular diagnosis does not require blood drawing, and has the characteristics of non-invasive, instant, and biopsy. It can be used to make up for the shortcomings of in vitro diagnosis such as blood tests and imaging, avoid the risks of invasive in vivo diagnosis, and is more suitable for the use of common diseases and chronic diseases in hospitals, grassroots physical examinations, and family self-examination. In recent years, exhaled breath molecular diagnosis technology has been increasingly valued by domestic and foreign governments, research and development institutions, and related medical organizations. Various organizations and institutions have formulated relevant policies, development plans, and standard guidelines to jointly promote the rapid development of clinical technology for exhaled breath molecular diagnosis. Exhaled breath molecular diagnosis or breath testing belongs to the emerging field of POCT technology. At present, the Helicobacter pylori breath test with the largest market size has a market history of less than 25 years, and the development of the inflammatory breath test product with the greatest market potential has only been 10 years, while breath testing technologies such as gastrointestinal flora metabolic disorders are still in the market cultivation stage. In addition, breath detection technologies such as breath NH<sub>3</sub>, H<sub>2</sub>S, VOC (volatile organic compounds), breath metabolomics and olfactory artificial intelligence (electronic nose) are still in clinical trials or waiting for drug regulatory certification and approval. In the past 30 years, with the gradual development of related technologies including breath detection abroad, the rapid growth of the domestic economy and the continuous development of the medical and health industry have provided a broad market space for the widespread application of this technology in China. At the same time, the development of domestic breath detection technology is almost synchronized with that of foreign countries, covering almost all areas of foreign breath detection, including the research of breath metabolomics and olfactory artificial intelligence, and many technologies are even ahead of foreign countries. It is one of the few emerging technology fields that may form a global leading breath detection in China. With the continuous advancement of the construction of the PCCM system, the demand for breath analysis products in secondary and tertiary hospitals will further expand. Portable instrument products,

handheld instrument products and other products for primary hospitals and home terminals are constantly being developed, and product application scenarios and usage needs will be further expanded. With the development of science and technology and artificial intelligence, future breathalyzers will be more intelligent and automated, with functions such as automatic identification, data analysis and report generation, reducing human intervention and improving diagnostic accuracy and efficiency.

The global Breath Test Detector market size was estimated at USD 263.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.70% during the forecast period.
