Report Overview

A Bridge-Type Coordinate Measuring Machine (CMM) is a type of metrology device used for precise measurement of objects or parts with three-dimensional (3D) geometries. It is widely employed in industries such as manufacturing, aerospace, automotive, and engineering. A Bridge-Type CMM consists of a stationary base or table, a bridge-like structure that moves along the X-axis, and a moving measuring probe assembly that moves vertically along the Z-axis. The object to be measured is positioned on the base, and the bridge and probe assembly are used to traverse and scan the object in three dimensions. The measuring probe used in a Bridge-Type CMM can be a touch probe or a non-contact probe, such as a laser scanner or vision system. The touch probe makes physical contact with the object's surfaces to record coordinate points, while the non-contact probe captures surface data using laser or optical technology without making direct contact. The collected data is then processed and analyzed using dedicated software to generate a precise digital representation of the object's geometry. This data can be utilized for quality control, dimensional analysis, reverse engineering, and other applications where accurate measurements are essential. Bridge-Type CMMs are known for their high accuracy, repeatability, and precision. They are capable of handling various object sizes and shapes, providing reliable and detailed measurements for quality assurance and inspection purposes. Their sturdy bridge structure ensures stability and rigidity, resulting in accurate measurement results.
