Report Overview

The broken finger float switch is a type of liquid level sensor designed to detect the presence or absence of fluid in tanks, sumps, or other containers. It consists of a hinged float arm with a magnetic or mechanical trigger that activates or deactivates a switch when the liquid level changes. Unlike traditional float switches with a sealed buoyant float, the "broken finger" design features a segmented or articulated arm that allows for more precise level detection and reduced sticking or false triggering in viscous or debris-laden fluids. These switches are commonly used in industrial, wastewater, and agricultural applications where reliability and durability are critical. The market for broken finger float switches is driven by demand from sectors such as oil and gas, chemical processing, and water treatment, where accurate fluid level monitoring is essential for operational efficiency and safety.
