### Report Overview

The BRT (Bus Rapid Transit) Signal Priority System is an advanced traffic management solution designed to enhance the efficiency and reliability of bus transit services within urban environments. This system integrates with existing traffic signal infrastructure to prioritize BRT buses at intersections, reducing travel times and improving overall service quality. The BRT Signal Priority System operates by detecting approaching BRT buses and adjusting traffic signal timings accordingly, allowing buses to pass through intersections with minimal delay. This is achieved through a combination of communication technologies, such as wireless communication between buses and traffic control centers, and sensor-based detection systems installed at intersections. The primary goal of this system is to increase the attractiveness of public transportation, reduce congestion, and promote sustainable urban mobility by ensuring that BRT services are punctual and efficient.
