### Report Overview

C-band tunable laser is a type of laser device that can output light with a wavelength in the C-band range, and can be adjusted continuously. Tunable laser refers to a laser that can continuously change the laser output wavelength within a certain range (see laser). The laser has a wide range of applications in spectroscopy, photochemistry, medicine, biology, integrated optics, pollution monitoring, semiconductor material processing, information processing and communications. There are roughly three principles for achieving laser wavelength tuning. Most tunable lasers use working substances with wide fluorescent lines. The resonators that make up the laser have very low losses only over a very narrow wavelength range. Therefore, the first is to change the wavelength of the laser by changing the wavelength corresponding to the low loss region of the resonator by some elements (such as a grating). The second is to shift the energy level of the laser transition by changing some external parameters (such as magnetic field, temperature, etc.). The third is the use of nonlinear effects to achieve wavelength transformation and tuning (see nonlinear optics, stimulated Raman scattering, optical frequency doubling, optical parametric oscillation). Typical lasers belonging to the first tuning mode are dye lasers, chrysoberyl lasers, color center lasers, tunable high-pressure gas lasers and tunable excimer lasers.
