Report Overview

Cadonilimab injection is a bispecific antibody drug designed to target both PD-1 and CTLA-4 immune checkpoint pathways, making it a dual immunotherapy for treating various cancers, particularly solid tumors like non-small cell lung cancer (NSCLC), gastric cancer, and hepatocellular carcinoma. By simultaneously inhibiting these two immune checkpoints, Cadonilimab aims to enhance the body's antitumor immune response more effectively than single-target therapies, potentially improving patient outcomes with a favorable safety profile. It represents an innovative approach in immuno-oncology, addressing limitations of monotherapies such as resistance or incomplete efficacy, and is positioned as a next-generation treatment option in competitive markets where PD-1/PD-L1 inhibitors dominate. Regulatory approvals and clinical trial results will heavily influence its adoption and commercial potential.
