Abstracts

Calcium hydroxide ($\text{Ca}(\text{OH})_2$), commonly known as lime or hydrated lime, is a common chemical substance widely used in many fields, including industry, agriculture, and environmental protection. Calcium hydroxide can also be used as a deoxidizer in certain applications. As a deoxidizer, the main function of calcium hydroxide is to absorb moisture and release the hydroxide in the calcium hydroxide. This process is called 'deoxygenation' because hydroxide is one of the building blocks of water, so by absorbing water and releasing hydroxide, moisture in the surrounding environment is reduced or eliminated. In certain situations where moisture content needs to be controlled, such as in some food processing, storage and transportation processes, deoxidizers can help prevent food spoilage or deterioration. The use of calcium hydroxide as a deoxidizer also has some limitations and precautions. For example, you need to pay attention to dosage control during use to avoid excessive use that may cause excessive drying of the moisture in the environment or have adverse effects. In addition, calcium hydroxide itself is alkaline, so its impact on environmental pH may need to be considered in some applications. In general, calcium hydroxide as a deoxidizer has a certain effect in specific applications, but its use requires reasonable control and management based on specific circumstances.

The global Calcium Hydroxide Oxygen Absorbers market size was estimated at USD 185.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
