Report Overview

Calcium-silicon alloy is a ferroalloy primarily composed of calcium (Ca) and silicon (Si), typically containing 28-35% calcium and 55-65% silicon, with trace amounts of iron, aluminum, and other impurities. It is widely used as a deoxidizer, desulfurizer, and alloying additive in steelmaking and cast iron production, improving fluidity, mechanical properties, and cleanliness of molten metal. The alloy also finds applications in the production of special steels, nodular cast iron, and welding materials, where its strong affinity for oxygen and sulfur enhances refining efficiency. Its unique properties, including high reactivity and low melting point, make it indispensable in metallurgical processes, particularly in high-grade steel manufacturing where strict impurity control is required. The demand for calcium-silicon alloy is closely tied to the steel industry's growth, with increasing emphasis on high-performance and environmentally sustainable steel production driving market expansion.
