Report Overview

A Cantilever Sensor is a type of mechanical sensor that operates on the principle of a cantilever beam, which is a rigid structure that is fixed at one end and free at the other. In the context of sensors, it is typically used to detect minute changes in force, pressure, or displacement by measuring the deflection or bending of the cantilever beam. Cantilever sensors are employed in various applications, including atomic force microscopy (AFM), where they can measure forces at the nanoscale, and in microelectromechanical systems (MEMS) for detecting environmental changes. These sensors are known for their high sensitivity and precision, making them valuable in scientific research, industrial processes, and medical diagnostics. The design of a cantilever sensor can vary, but it generally consists of a thin, flexible material that bends in response to an applied force, with the degree of bending being proportional to the magnitude of the force. Advanced cantilever sensors may incorporate piezoelectric or optical readout mechanisms to convert the mechanical deflection into an electrical signal for measurement and analysis.
