### Report Overview

A Capillary Thermostat is a type of thermostat that uses a capillary tube with a temperature-sensitive fluid control a heating or cooling system. The capillary tube is made of a flexible material and is connected to a sensing bulb located in the desired temperature zone. As the temperature changes, the fluid expands or contracts within the capillary tube, exerting pressure on a diaphragm or bellows mechanism that operates the electrical contacts of the thermostat. This action either turns the system on or off, maintaining the desired temperature range. Capillary Thermostats are commonly used in various applications, including household appliances, HVAC systems, and industrial processes.
