### Report Overview

The capsular tension ring (CTR) is a medical device used in ophthalmology to stabilize the lens capsule during cataract surgery, particularly in cases where zonular weakness or dehiscence compromises the structural integrity of the capsule. Made from biocompatible materials such as polymethyl methacrylate (PMMA) or flexible polymers, CTRs are implanted into the capsular bag to provide mechanical support, preventing intraoperative and postoperative complications like lens dislocation or capsular phimosis. The device plays a critical role in complex cataract surgeries, ensuring proper intraocular lens (IOL) placement and improving surgical outcomes. Its adoption is driven by the rising prevalence of cataracts, an aging population, and advancements in minimally invasive surgical techniques. However, challenges such as surgical skill requirements, regulatory approvals, and cost constraints in emerging markets may impact growth. The CTR market is also influenced by innovations in design, including adjustable and segmental rings, which cater to varying degrees of zonular instability. Competition among manufacturers focuses on material durability, ease of implantation, and compatibility with advanced IOLs, while reimbursement policies and healthcare infrastructure further shape market dynamics.
