Report Overview

A car piston ring is a critical component of an internal combustion engine, specifically designed to seal the gap between the piston and the cylinder wall, ensuring efficient combustion and minimizing oil consumption. These rings are typically made from materials such as cast iron or steel, and are shaped in a way that they expand when heated, creating a tight seal against the cylinder wall. The primary function of a piston ring is to control the flow of gases and liquids within the engine, preventing the escape of combustion gases and the entry of oil into the combustion chamber. Additionally, they help in maintaining proper lubrication and reducing friction between the piston and cylinder wall, thereby enhancing the engine's performance and longevity. Piston rings are an essential part of the engine's design, contributing to its overall efficiency and reliability.
