Report Overview

Carbon Capture, Utilisation, and Storage (CCUS) refers to technologies designed to capture carbon dioxide emissions from industrial processes or directly from the atmosphere, either for permanent storage underground (sequestration) or for reuse in industrial applications such as enhanced oil recovery, synthetic fuel production, or as a feedstock in manufacturing. The process typically involves three key stages: capture (using absorption, adsorption, or membrane separation), transport (via pipelines or ships), and either storage in geological formations or utilization in commercial products. CCUS is increasingly viewed as a critical component in global decarbonization strategies, particularly for hard-to-abate sectors like cement, steel, and chemicals production, where alternative emission reduction methods are limited. The technology is evolving rapidly, with advancements in capture efficiency, cost reduction, and scalable deployment models, though challenges remain in policy support, infrastructure development, and public acceptance.
