Abstracts

Chain carbonate has lower viscosity than cyclic carbonate, better electrochemical stability, and can improve the low temperature performance of electrolyte. Chain carbonate accounts for about 60% by mass in the solvent, and is divided into dimethyl carbonate (DMC), diethyl carbonate (DEC), and ethyl methyl carbonate (EMC). The proportions of the three are quite different in different battery types. The proportion of EMC in ternary batteries is relatively high, and the proportion of DMC in lithium iron phosphate batteries is relatively high. Carbonate solvents are a class of organic solvents widely used in chemical and industrial applications. These solvents primarily consist of carbonate compounds such as propylene carbonate and butylene carbonate. Carbonate solvents are characterized by low toxicity, low volatility, and environmental friendliness, making them an ideal choice in various fields. In industrial applications such as coatings, inks, adhesives, and cleaning agents, carbonate solvents are extensively used as solvents and diluents. They are also employed in the electronics industry for degreasing and cleaning processes. Due to their excellent performance and eco-friendly characteristics, carbonate solvents are gaining attention as alternatives to traditional organic solvents.

The global Carbonate Ester Solvents market size was estimated at USD 358.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
