Report Overview

Carboxyl cellulose nanoparticles (CCNPs) are a type of nanoscale material derived from cellulose, a natural polysaccharide found in plant cell walls. These nanoparticles are characterized by the presence of carboxyl groups, which are introduced through chemical modification processes such as carboxymethylation. The carboxyl groups confer anionic properties to the nanoparticles, enhancing their solubility in water and their ability to interact with other molecules. CCNPs possess unique properties such as high surface area, biocompatibility, and biodegradability, which make them suitable for various applications in fields like drug delivery, tissue engineering, and environmental remediation. Their small size allows for efficient penetration into biological systems, and their carboxyl groups can be further functionalized to attach specific molecules, making them versatile tools in nanotechnology and material science.
