Report Overview

Carboxyl Graphene is a chemically modified form of graphene, a single layer of carbon atoms arranged in a two-dimensional honeycomb lattice. In this derivative, functional carboxyl groups (-COOH) are introduced to the graphene surface, typically through oxidation processes. This modification enhances the solubility and processability of graphene, making it more compatible with various applications. Carboxyl graphene can be used in a wide range of fields, including energy storage, composite materials, and electronics, due to its improved dispersion in solvents and polymers, as well as its ability to form covalent bonds with other molecules. The introduction of carboxyl groups also allows for further functionalization, enabling the attachment of various molecules to the graphene surface, which can tailor its properties for specific applications.

In 2024, the global Carboxyl Graphene market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
