Report Overview

Carboxyl Graphene Quantum Dots (CGQDs) are a type of nanomaterial derived from graphene, a single layer of carbon atoms arranged in a two-dimensional lattice. These quantum dots are characterized by their small size, typically ranging from 1 to 10 nanometers, which gives them unique optical and electronic properties. The term "carboxyl" refers to the presence of carboxylic acid functional groups (-COOH) on the surface of the graphene quantum dots, which can enhance their solubility in water and their ability to interact with other molecules. CGQDs exhibit strong photoluminescence, making them suitable for applications in bioimaging, sensing, and as fluorescent markers. Their surface functionalization with carboxyl groups also allows for further chemical modification, enabling the attachment of various molecules for targeted applications in drug delivery, environmental sensing, and more. The combination of these properties makes CGQDs a versatile and promising material in the field of nanotechnology.
