Report Overview

Cardiac Glycosides are a class of naturally occurring, steroidal compounds that have a significant impact on the cardiovascular system. These compounds are primarily derived from plants and are known for their ability to increase the force of cardiac muscle contractions, thereby enhancing the efficiency of the heart's pumping action. They function by inhibiting the sodium-potassium ATPase enzyme, which leads to an increase in intracellular calcium levels and, consequently, a stronger contraction of the heart muscle. Cardiac glycosides are used medically to treat conditions such as congestive heart failure and certain types of arrhythmias. Examples of cardiac glycosides include digoxin, digitoxin, and ouabain. Their use is carefully regulated due to their narrow therapeutic index, meaning that the difference between a therapeutic dose and a toxic dose is small, requiring precise dosing to avoid adverse effects.
