Abstracts

Cardiac-on-a-Chip is a biosimulation technology designed to simulate the structure and function of the human heart. This technology is usually implemented on a microfluidic chip or a microbial chip. Artificially cultured cardiomyocytes are planted on the chip through tissue engineering and biotechnology methods to simulate various characteristics of a real heart, such as myocardial contraction, cardiac electrical activity, etc. Heart-on-a-chip can be used to simulate cardiac physiology, study the pathogenesis of heart disease, evaluate the efficacy and toxicity of drugs, and develop new treatments for heart disease. This technology provides a highly controllable and reproducible experimental platform for heart-related research, helps understand cardiac physiology and pathology, and accelerates the diagnosis and treatment of heart diseases. As an emerging market segment in the biomedical field, the cardiac chip market has received widespread attention in recent years. As the global population ages, the prevalence of heart disease increases year by year, which provides a broad space for development of the cardiac chip market. As an innovative medical technology and tool, the market size of cardiac chips is constantly expanding. Cardiac chips have wide applications in many fields, including diagnosis of heart disease, drug screening, toxicity testing, and personalized medicine. By simulating the structure and function of heart tissue, the heart chip can provide a more accurate and efficient experimental platform and promote the research and treatment of heart diseases. Overall, the cardiac chip market has broad development prospects and huge market potential.

The global Cardiac-on-a-Chip market size was estimated at USD 1086.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.50% during the forecast period.
