Report Overview

A Cardiotomy Reservoir is a specialized medical device designed for use in cardiac surgery, specifically for collecting and temporarily storing blood during open-heart procedures. It is an essential component of the cardiopulmonary bypass circuit, which is used to maintain circulation and oxygenation of the blood while the heart is stopped or not functioning normally. The reservoir serves as a container that holds blood that has been drained from the patient's body, allowing it to be filtered, oxygenated, and then returned to the patient. It is typically made of a transparent, durable material that allows for easy visualization of the blood level and quality. The design of a cardiotomy reservoir often includes features such as drainage ports, oxygenation capabilities, and mechanisms for mixing and agitation to ensure proper oxygenation and to prevent blood from clotting. This device plays a critical role in the safety and efficacy of cardiac surgical procedures, contributing to the overall success of the operation by ensuring that the patient's blood is managed effectively throughout the process.
