Report Overview

Carvin injection, whose official or common name is fat emulsion amino acid (17) glucose (11%) injection, is a parenteral nutrition drug. Carvin injection is mainly used for adult patients who cannot take nutrition orally or enterally due to digestive system diseases or other reasons. By providing necessary nutrients such as glucose, amino acids and fat emulsion, it helps patients maintain nitrogen balance, provide energy and maintain nutritional balance. Carvin injection provides patients with comprehensive and balanced nutritional support through intravenous infusion. Carvin injection consists of three independent chambers, each containing glucose injection, amino acid injection and fat emulsion injection. Before infusion, the peelable seal needs to be opened to mix the liquids in the three chambers evenly, and then the liquids are infused into the patient through the intravenous catheter. Because the composition and ratio of Carvin injection are carefully designed to simulate the normal nutritional intake of the human body, it is widely used in clinical practice to provide patients with safe and effective parenteral nutrition support. At the same time, the use of Carvin injection also needs to be carried out under the guidance of professional medical staff to ensure the safety of patients and the treatment effect.
