Abstracts

Renal Denervation (RDN) is a percutaneous interventional treatment method. It mainly uses energy such as radio frequency and ultrasound to eliminate the afferent and efferent nerves in the renal artery, blocking the signal conduction between the brain and sympathetic nerves to a certain extent, thereby reducing the risk of high blood pressure. The sympathetic nerve excitability of patients with high blood pressure can achieve long-term and stable blood pressure lowering effects with one minimally invasive surgery.

The global Catheter Based Renal Denervation System market size was estimated at USD 475.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.80% during the forecast period.
