Abstracts

Cationic Rapid Setting (CRS) Asphalt Emulsion is a type of asphalt emulsion used primarily for chip sealing, tack coats, and seal coating in road construction. The 'cationic' refers to the electrical charge of the emulsion particles, which are positively charged, and 'rapid setting' indicates the quick curing time once the emulsion is applied. In CRS asphalt emulsions, the asphalt particles are emulsified in water using cationic emulsifiers. This allows the asphalt to mix with the aggregate at ambient temperatures effectively. The rapid setting nature of the emulsion is due to the chemical composition that causes the emulsified asphalt to break quickly on contact with the aggregate. This quick break allows for faster traffic return on newly applied surfaces. CRS emulsions are designed to adhere well to both the aggregate and the underlying road surface, providing durable, water-resistant coverage that can withstand traffic wear and environmental conditions.

The global Cationic Rapid Setting Asphalt Emulsion market size was estimated at USD 385.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
