Report Overview

CDKL5 deficiency disorder (CDD) is a rare developmental epileptic encephalopathy (DEE), X-linked genetic condition which results in early-onset, difficult to control seizures and severe neuro-developmental impairment. CDKL5 stands for cyclin-dependent kinase-like 5 and mutations in this gene were first identified as disease-causing in 2004. CDD was previously not considered as a separate indication; rather, it was assumed to be an atypical form of Rett Syndrome. The CDKL5 gene provides instructions for making proteins that are essential for normal brain and neuron development. The condition was previously known as serine/threonine-protein kinase 9 (STK9), and it has been classified as DEE because the genetic change causes epileptic activity as well as severe impairment of the development. The CDKL5 gene is located on the X chromosome. The X chromosome is one of the sex chromosomes; females have two X's, and males have one X and one Y chromosome. Although many identified patients are males, because of the location of the gene, this disorder mainly affects females. Affected males may have more severe symptoms than females.
