Report Overview

Ceramic capillaries are specialized microfluidic components typically made from high-purity alumina or zirconia, designed to transport liquids or gases in controlled volumes through capillary action or pressure-driven flow. These components are valued for their chemical inertness, thermal stability, and mechanical strength, making them suitable for demanding applications in industries such as medical diagnostics (e.g., microfluidics for lab-on-a-chip devices), analytical instrumentation (e.g., chromatography columns), and precision manufacturing (e.g., fiber-optic coating). Their ability to maintain structural integrity under high temperatures and corrosive environments further distinguishes them from polymer-based alternatives, positioning ceramic capillaries as critical components in advanced scientific, industrial, and biomedical systems where precision and durability are paramount.
