### Report Overview

Cell cryoprotectants are substances used in cryopreservation to protect cells from damage caused by the formation of ice crystals during freezing. These compounds are added to the cells before freezing to prevent ice formation and minimize the harmful effects of extreme temperatures. Cryoprotectants act by reducing the freezing point of the intracellular and extracellular fluids, thus allowing cells to survive the freezing and thawing process with minimal damage. Common cryoprotectants include glycerol, dimethyl sulfoxide (DMSO), and ethylene glycol. The use of cryoprotectants is crucial in various fields, including cell biology, medicine, and assisted reproductive technologies, where the preservation of cell viability and functionality is essential for successful long-term storage.
