Abstracts

Cell cycle inhibitors are a class of therapeutics that target the cell cycle, the process by which a cell duplicates its contents and divides into two daughter cells. The cell cycle is tightly regulated, and dysregulation can lead to uncontrolled cell division, a hallmark of cancer. Cell cycle inhibitors are used in cancer treatment to disrupt the cell cycle progression of cancer cells, thereby inhibiting their growth and promoting cell death. These inhibitors may act at different points in the cell cycle, preventing the cancer cells from proliferating.
