## Abstracts

Cell-free cartilage repair refers to a regenerative treatment approach aimed at repairing damaged cartilage without the use of exogenously introduced cells. Instead of transplanting cells into the damaged area, this technique typically involves using scaffolds, growth factors, or other biological substances to stimulate the body's own repair mechanisms. The goal is to promote the regeneration of cartilage tissue naturally, thereby restoring joint function and reducing pain associated with conditions like osteoarthritis or cartilage injuries. This approach is often considered for its potential to avoid complications associated with cell-based therapies while offering a promising avenue for effective cartilage repair in orthopedic and sports medicine practices.

The global Cell Free Cartilage Repair market size was estimated at USD 1011.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
