Report Overview

A Cell Metabolic Analyzer is a sophisticated scientific instrument designed to assess the metabolic activity of cells in vitro. It functions by measuring the oxygen consumption rate (OCR) and extracellular acidification rate (ECAR) of cells, which are key indicators of cellular metabolism. The OCR reflects the mitochondrial respiration and energy production, while the ECAR indicates glycolysis, the process by which cells convert glucose into energy. This analyzer is equipped with specialized sensors and software that enable researchers to monitor these parameters in real-time, providing valuable insights into cellular health, function, and response to various stimuli or treatments. It is widely used in fields such as cell biology, drug discovery, and toxicology to study the effects of compounds on cell metabolism, assess the metabolic phenotype of different cell types, and investigate the metabolic changes associated with disease states or cellular transformation.
