Abstracts

Cementless total knee arthroplasty (TKA) is a surgical procedure used to replace a damaged or diseased knee joint with artificial components without the use of bone cement. In this procedure, the damaged surfaces of the knee joint are removed and replaced with prosthetic components made of biocompatible materials such as metals, ceramics, and polymers. Unlike traditional TKA procedures that rely on bone cement to adhere the prosthetic components to the bone, cementless TKA utilizes specialized implants with porous surfaces that encourage bone ingrowth, allowing the natural bone to grow into the implant for stability and fixation. Cementless TKA is particularly beneficial for younger, active patients and those with good bone quality, as it may result in better long-term implant survival and reduced risk of complications associated with cemented implants.

The global Cementless Total Knee Arthroplasty market size was estimated at USD 3250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
