Report Overview

Central Venous Access Catheters (CVACs) are medical devices designed to provide long-term access to the central venous system for the administration of medications, fluids, and blood products, as well as for the collection of blood samples. These catheters are typically inserted into a large vein, such as the subclavian, internal jugular, or femoral vein, and can be used for various purposes, including chemotherapy, parenteral nutrition, and hemodialysis. CVACs are composed of a flexible, biocompatible material, such as silicone or polyurethane, and may be single or double lumen, depending on the intended use. They are often equipped with a valve or hemostasis valve at the hub to prevent backflow of blood and reduce the risk of infection. Proper insertion and maintenance of CVACs are crucial to minimize complications such as infection, thrombosis, and catheter-related bloodstream infections.
