### Report Overview

Centre Pivot Irrigation is also called circle irrigation and water-wheel system. This is a method of crop irrigation system that has equipment that rotates around a pivot and the crop is watered through sprinklers. The circular that is centred in the pivot is irrigated. The crop is also created in a circular pattern when it is viewed from above. Previously the Centre Pivot Irrigation was water-powered but today owing to technological advancements most of the crops are propelled by electric motors. Centre Pivot Irrigation is beneficial as it can efficiently use water and optimize the field's yield. The Centre Pivot Irrigation requires less labour as compared to other surface irrigation methods such as furrow irrigation. It also has less labour cost as in this Centre Pivot Irrigation, digging of channels is not required. The Centre Pivot Irrigation reduces the amount of the soil tillage; hence it decreases the water runoff and soil erosion that mostly occurs with the ground irrigation techniques. As in Centre Pivot Irrigation, less, tillage is required so it encourages more organic materials and the residue of the crop to decompose back into the soil. Centre Pivot Irrigation also decreases soil compaction. All these factors are promoting the growth of the Centre Pivot Irrigation system which is further leading to the growth in the Centre Pivot Irrigation System Market during the forecast period.
