Abstracts

Centrifuges in mineral processing are specialized machines used to separate particles of different densities within a slurry or suspension by applying centrifugal force. They operate at high rotational speeds, creating a force that pushes heavier particles outward and lighter particles inward. This enables efficient separation, thickening, and dewatering of minerals such as coal, ores, and sand, commonly used in mining and refining industries. By concentrating valuable minerals and removing water from waste material, centrifuges improve recovery rates, reduce handling costs, and optimize downstream processing steps.

The global Centrifuges For The Mineral Processing market size was estimated at USD 1350.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
