## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ceramic Substrate for Probe Card competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Ceramic Substrate for Probe Card sales reached approximately 12,536 units, with an average global market price of around US\$11,793 per unit. IC testing packages require increased size and greater precision in silicon wafer pad positioning to reduce the number of tests. These test tool ceramic packages are used in running electrical tests with probes (needles) brought into contact with IC (wafer) terminals. They are used as relay substrates to mechanically and electrically connect the probe and PCB in the probe card. Thin film technologies are used to form high-precision terminals on alumina ceramic multilayer substrates of over 20 layers. The future development trends of Ceramic Substrate for Probe Card are mainly: 1. Higher test density With the continuous advancement of integrated circuit (IC) technology, the integration of chips is getting higher and higher, especially the demand for system-on-chip (SoC), AI chips and high-performance computing chips has driven the increase in test density. Probe card substrates will need to support more probes (with higher probe arrangement density) to achieve comprehensive testing of chips. The substrate will develop towards higher precision and finer structures to meet this high-density testing demand. 2. More miniaturization and high integration In order to adapt to modern electronic devices and high-density packaging technologies (such as 3D packaging, system-level packaging (SiP)), probe card substrates will tend to be miniaturized and highly integrated. This will not only reduce space occupancy, but also improve test efficiency. Miniaturization design will also make probe cards more suitable for portable and low-power devices. 3. Multifunctional integration As chip testing requirements become more complex, substrates will not only play the role of mechanical support and

electrical connection, but may also integrate more functions, such as temperature monitoring, humidity control, automatic adjustment, etc. For example, in high-power semiconductor testing, the substrate may need to integrate more heat dissipation technology or liquid cooling solutions to ensure test stability and accuracy.

4. Application of new materials Ceramic substrates are still the mainstream material, but with the demand for higher efficiency and lower cost, composite substrates (such as ceramic and metal composites, ceramic and plastic composites) and glass substrates are expected to become new development directions. New materials will improve the thermal management performance, mechanical strength, corrosion resistance and signal transmission efficiency of the substrate, and help reduce production costs.

5. Automation and intelligence As the semiconductor manufacturing and testing process develops towards intelligence and automation, the probe card substrate will be closely integrated with automated testing equipment and intelligent diagnostic systems to improve test accuracy, efficiency and reliability. The substrate may integrate intelligent control systems, such as real-time monitoring of temperature, pressure, and displacement, to optimize the test process and reduce manual intervention.

6. Cost optimization and domestic substitution As the global semiconductor industry gradually moves towards localized production and domestic substitution, the production of probe card substrates will pay more attention to reducing costs. The rapid growth of the Chinese market may also prompt more local manufacturers to invest in the research and development of probe card substrates, driving further cost reductions.

The global Ceramic Substrate for Probe Card market size was estimated at USD 148.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
