Report Overview

Cerium Oxide Nanorods are a type of nanoscale material composed of cerium oxide (CeO₂), which is a well-known ceramic compound with unique properties. These nanorods exhibit a one-dimensional, elongated structure, which is significantly smaller in diameter than their length. They are characterized by their high surface area to volume ratio, which enhances their reactivity and catalytic properties. Cerium Oxide Nanorods are synthesized using various methods, including hydrothermal synthesis, sol-gel processes, and chemical vapor deposition. They possess a wide range of applications, particularly in the fields of catalysis, where they can be used for the purification of exhaust gases, and in the production of solid oxide fuel cells due to their excellent ionic conductivity. Additionally, they are utilized in the electronics industry for the fabrication of sensors and in the biomedical field for drug delivery systems.
