Report Overview

Cervical Cancer Screening Service is a comprehensive medical program designed to detect and prevent cervical cancer in women. This service involves the systematic examination of a woman's cervix, the lower part of the uterus that connects to the vagina, to identify any abnormal cells or changes that may indicate the presence of cervical cancer or its precursors. The primary goal of this service is early detection, which allows for timely intervention and treatment, ultimately reducing the incidence of invasive cervical cancer. The screening process typically includes tests such as the Pap smear, which examines cells from the cervix for abnormalities, and the HPV test, which detects the presence of human papillomavirus, a major risk factor for cervical cancer. The service may also involve counseling on risk factors, vaccination against HPV, and follow-up care for those who test positive for precancerous changes. Regular cervical cancer screening is crucial for women's health, as it can significantly reduce mortality rates associated with this type of cancer.
