Report Overview

A Cervical Disc Prosthesis is a medical device designed to replace a damaged or degenerated intervertebral disc in the cervical spine. This prosthetic device is typically made from biocompatible materials such as metal alloys, polymers, or ceramics, and is engineered to mimic the natural motion and load-bearing properties of a healthy disc. The primary function of a cervical disc prosthesis is to restore normal spinal function, alleviate pain, and improve the quality of life for patients suffering from conditions like cervical disc degeneration, herniated discs, or other spinal disorders. The device is implanted during a surgical procedure, where the damaged disc is removed and replaced with the prosthesis, allowing for continued movement and flexibility in the neck while reducing the risk of further degeneration or nerve compression.
