## Abstracts

Chain carbonate has lower viscosity than cyclic carbonate, better electrochemical stability, and can improve the low temperature performance of electrolyte. Chain carbonate accounts for about 60% by mass in the solvent, and is divided into dimethyl carbonate (DMC), diethyl carbonate (DEC), and ethyl methyl carbonate (EMC). The proportions of the three are quite different in different battery types. The proportion of EMC in ternary batteries is relatively high, and the proportion of DMC in lithium iron phosphate batteries is relatively high. As a novel class of organic solvents, chain carbonate solvents are gradually gaining prominence in the market. Their advantages in solvency, environmental friendliness, and chemical stability make them increasingly favored across multiple industries. The market size is expanding, with sales steadily growing, particularly in the applications within industries such as coatings, inks, adhesives, and more. Specific uses of chain carbonate solvents in these sectors include pigment dissolution, enhancing the flow of coatings, and substituting traditional organic solvents to reduce volatile organic compound emissions. In the future, with the strengthening of environmental regulations and the growing demand for low-volatility solvents, chain carbonate solvents are expected to witness broader global applications and development.

The global Chain Carbonate Solvent market size was estimated at USD 611.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
