Report Overview

Charge Trap Flash technology is charge trap flash technology, which is a NAND flash technology based on charge capture mechanism. Charge Trap Flash technology stores data by creating charge traps in a medium with a high dielectric constant. These traps can effectively "capture" and retain charges for a long time, thereby achieving non-volatile storage of data. CTF storage cells are usually composed of two metal layers and a controlled layer, which is filled with insulating materials with high charge capture density (such as silicon nitride), which form charge traps. CTF technology has been widely used in mobile devices, SSDs (solid state drives), smart cards, and automotive electronics. With the continuous expansion of application scenarios and the continuous advancement of technology, CTF technology is expected to play a more important role in the future.
